Auto Ticket Classification using FLOW DESIGNER

Requirement Analysis Phase

Team Leader: K. Prasanna | Members: R. Nithisa Shirin, S. Nigmatha Nisha, Misha Nandhini N.

• Purpose: convert the selected idea into clear requirements.

• Functional requirements: capture Caller and Short Description; store Category/Subcategory; inspect description; classify matching keywords; send confirmation email.

• Ticket fields: Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned To.

• Classification requirements cover Wi-Fi, Projector, Password and Slow/Hanging issue types.

Auto Ticket Classification using FLOW DESIGNER

Requirement Analysis Phase – Continued

• Non-functional requirements: maintainable, consistent, testable and extendable ServiceNow configuration.

• Notification: caller receives automated confirmation after submission.

• Security: only authorized users configure the solution and ticket data remains in ServiceNow.

• Constraints: keyword matching depends on recognizable wording; unmatched descriptions need manual handling.

• Acceptance: ticket creation, correct mapping, fallback behavior and email confirmation.

• Outcome: requirements baseline ready for design.
